

Tejas Boost
Tejas Drive
Tejas Overdriver

The Tejas family of pedals are all based on the same circuit that goes from chimey boost to uncompressed, musical breakup. The tone controls are useful across their entire ranges, letting you add sparkle, cut some tubby-ness, or otherwise modify your tone to exactly what you're looking for. Max out the Gain control, and the well-behaved Tejas gives way to a decidedly unruly distortion sound that ventures into fuzz characteristics.

The Tejas Boost and Overdriver have high-voltage orange drop capacitors while the Drive has smaller, film capacitors.

The Tejas Overdriver and Tejas Drive have an external volume control that makes it easier to dial overdriven and fuzzy sounds while keeping unity gain.

The Tejas Boost has the same volume control available as an internal trim pot. The factory setting for this trim pot is such that Tejas Boost has unity output when the Gain control is set to 11 o'clock.

Power Requirements:
9 VDC adapters only
<15mA current draw
